GROUND WATER ASSESSMENT,
11 CHITTY ROAD ,
TOODYAY, WA

1 INTRODUCTION

Opal Vale Pty Ltd (Opal Vale) intends to develop a landfill on this site of the old clay pit at 11 Chitty Road, Toodyay, at some stage. To fulfill regulatory requirements, a groundwater review had to be undertaken.

To be able to define the groundwater conditions at the site, nine groundwater monitoring bores were installed to provide information on:

1. the depth of the water table,
2. the groundwater quality; and
3. the geology below the site

The regional geology and hydrology of the area was reviewed by a literature review of available data on the region obtained from the Geological Survey of Western Australia.

The site was found to be located on weathered schists (fine clayey) geologic materials with expected low transmissivity and groundwater yield. This would suggest that the site is suitable for the activities which are intended by Opal Vale in that the impact on groundwater from the proposed landfill is expected to be minimal if any.

This report provides the detail of the groundwater investigations and monitoring bore installation programme as well as the groundwater quality analytical results for the site.

2 OBJECTIVES

The objectives of this study are to:

- Review of available regional groundwater and geology data.
- Install groundwater monitoring bores to suit the proposed landfill
- Obtain baseline groundwater quality data from the site.
- Provide a detailed report on the work

3 TERMS OF REFERENCE

Mr. Sam Mangione of Opal Vale Pty Ltd requested that Stass Environmental submit a proposal for the groundwater site assessment, baseline groundwater quality database and installation of groundwater monitoring bores at the Opal Vale facility.

4 SCOPE OF WORK

The following scope of work was carried out:

a) Review of all available data and reports

Review all available data on the groundwater studies performed to date for the development.

b) Provide a short synthesis of the available information

The reviewed reports are to be synthesized into a short form format, to provide a summary of the groundwater status at the site.

c) Assessment of available information

The available information is to be assessed for correctness and adequacy in terms of the proposed development and installation and logging of monitoring bores.

d) Reporting

The information and the interpretation of the data are presented in this document as a stand-alone report.

5 DISCRIPTION OF THE REGION

5.1 LOCATION

The Toodyay geological zone lies approximately 70km east of Perth in Western Australia and covers an area of approximately 2km^2 (Figure 1).

5.2 CLIMATE

The region experiences a Mediterranean climate, characterised by warm dry summers and cool wet winters. During summer (September to March) a belt of anticyclones lies over the region producing dry easterly winds and high temperatures. During winter this belt moves north and the predominant winds blow onshore from the south-west bringing cool temperatures and cold fronts that produce 90% of the region's total annual rainfall. Average annual rainfall varies between 300mm and 420mm and the average daily temperatures range from 17^{o}C to 30^{o}C in summer and from 6 ^{o}C to 17 ^{o}C in winter.

TABLE 1 Rainfall Records, Northam Station No 010111 (shown as mm/month)

Month	Mean 1902-2014	Mean 1980-2010	2013	2014
January	10.3	17.7	18.4	1.2
February	13.2	16.9	5.8	2.4
March	18.3	16	65.7	0.6
April	23.3	20.2	12.2	48.8
May	55.4	51.1	54.4	77.2
June	79.5	69.8	5.6	45.2
July	82.3	74.7	65.1	87.0
August	60.6	55.6	80.1	41.2
September	37.5	39.2	75.3	41.8
October	24.8	22.1	24.7	50.8
November	12.4	17.3	0.2	8.6
December	9.3	10.1	3.2	
TOTAL ANNUAL	427.1	410.8	410.7	

Over the period 1877 to the present the following rainfall statistics apply:

Mean – 427.1 mm/yr *Median* – N/A mm/yr

Lowest – 194.1 mm/yr *Highest* – 710.9 mm/yr

TABLE 2 Mean maximum temperature records, Northam, Station No.010111 (in degrees C)

Month	Mean 1902-2014	2012	2013

5.3 GEOLOGY AND LANDFORMS

5.3.1 Geology - Regional

Main geological components of the southwest Yilgarn Craton

The area is characterized by discrete, linear metamorphic belts enveloped by diffuse areas of migmatite, containing isolated rafts of the earlier gneissic sequences (Wilde, 1990). The present distribution of gneiss and migmatite is largely controlled by the emplacement of Late Archaean granitoids which typically post-date metamorphism and regional tectonism. The high-grade gneisses and supracrustal rocks have been grouped within the Jimperding, Chittering and Balingup Metamorphic Belts (Wilde, 1980 and 1990). Migmatite is locally developed at the margins of these belts and also forms more extensive areas in the eastern part of the region. There are also a number of small greenstone belts, ranging in metamorphic grade from greenschist to granulite facies, widely distributed across the region (Fig. 1). All these sequences are intruded by a variety of granitoids, including charnockites in the east.

Metamorphic Belts

The chief rock-type in the Jimperding, Chittering and Balingup Metamorphic Belts is layered quartz-feldsparbiotite gneiss. Some units are paragneiss and show gradations to arkosic quartzite and quartz-mica schist and are interleaved with orthoquartzite, banded iron formation and rare calc-silicate rocks. This association is a characteristic feature of the Jimperding Metamorphic Belt east and southeast of Toodyay and of the south-eastern part of the Balingup belt. It has been interpreted as indicating stable shelf sedimentation on a pre-existing sialic basement (Gee ***et*** *al.,* 1981; Wilde, 1990). In contrast, the Chittering and western portion of

the Balingup Metamorphic Belt consist mainly of pelite, semi-pelite and greywacke. Banded iron formation and quartzite are absent and this association has been interpreted to be the result of rapid, trough-style sedimentation along a continental margin (Gee ***et*** al.,1981; Wilde, 1990).

The Jimperding Metamorphic Belt shows a progressive eastward increase in metamorphic grade fiom lower amphibolite to granulite facies, with the presence of andalusite, sillimanite and cordierite indicating low pressure. In contrast, the Chittering and Balingup Metamorphic Belts are chiefly at amphibolite facies, with the presence of kyanite, sillimanite and staurolite indicating moderate pressure, Barrovian-type metamorphism (Wilde, 1990). This contrast in grade between the metamorphic belts appears to be in part related to their location, with the higher pressure assemblages occurring at the western margin of the craton, associated with ductile shear zones related to early movement along the Darling Fault Zone (Blight ***et*** *aZ.,* 1981; Bretan, 1985). This zone has been reactivated at several later periods, resulting in local retrogression to greenschist facies assemblages.

Greenstone Belts

There are a number of small greenstone belts present in the Western Gneiss Terrain. In the south-eastern portion (Fig. l), areas of mafic and felsic granulite are interleaved with a variety of metasedimentary rocks. These were interpreted as 'keels' of original greenstone belts by Wilson (1969) and this interpretation is supported by more recent work on the mafk granulites (Wilde and Pidgeon, 1987; Nemchin ***et aZ.,*** in press). The mineralogical features indicate that this area underwent low to moderate pressure granulite facies metamorphism and the enclosing granitoids commonly include hypersthene-bearing charnockites (Wilde, 1990).

Three lower grade greenstone belts are present near the western margin of the Yilgam Craton; the Saddleback, Morangup and Wongan Hills Greenstone Belts. The Saddleback Greenstone Belt (Wilde, 1976 and 1990) near Boddington (Fig. 1) is poorly-exposed due to an extensive cover of Tertiary laterite. It is composed of mafic and felsic volcanic rocks, with minor sedimentary units, metamorphosed to greenschist facies and generally in faulted contact with orthogneiss, migmatite and granite. However, in the extreme southwest, granite intrudes metasediments and felsic pyroclastic rocks (Wilde, 1976). The Morangup Greenstone Belt near Toodyay (Wilde and Pidgeon, 1990) consists predominantly of metabasalt with a greenschist facies assemblage of tremolite-actinolite, albite and clinozoisite. Porphyritic andesite and fine grained metasedimentary rocks are also present. The sequence is also poorly exposed and the full extent of the belt is unknown. The Wongan Hills Greenstone Belt consists predominantly of basalt, dacite, chert, banded iron formation and mica schist, interleaved with paragneiss and intruded by small ultramafic units, all metamorphosed to upper amphibolite facies (Carter and Lipple, 1982). The presence of cordierite indicates low pressure conditions, similar to those in the nearby Jimperding Metamorphic Belt (Pidgeon ***et al.,*** 1990).

Granitoids

Granitoids occur as two large batholiths that occupy a considerable portion of the southwest Yilgarn Craton. The granitoids east of Meckering and Quairading and around Lake Grace were informally referred to as the "Wheat Belt" granites by Wilson (1958), whereas the western area has been termed the Darling Range Batholith (Wilde and Low, 1978). The zone of mignatite referred to above separates the two batholithic areas.

Around Katanning many porphyritic granites are hypersthene-bearing and petrographically and geochemically identical to those developed further east within the zone of migmatite and gneiss south of Quairading and in the "Wheat Belt" batholith. Wilde and Pidgeon (1987) describe reaction textures from near Lake Grace which indicate that hypersthene and subsequent mafic minerals followed a magmatic crystallisation sequence and that these charnockites are of igneous origin.

The granitoids of the Darling Range Batholith are quite diverse and show considerable textural variation. They range in composition from granodiorite to granite; the compositional variations being commonly independent of textural changes. Where cross-cutting relations can be identified, granodiorite is invariably the earliest phase. Most granitoids are undeformed, although plutons of porphyritic granite that occur close to the eastern boundaries of the Chittering and Balingup Metamorphic Belts show evidence of intense ductile shearing. There is a westward increase in deformation, resulting in a progressive change from porphyritic granite to augen gneiss, mylonite and ultramylonite (Blight ***et*** *aL,* 1981). This deformation is related to early movement along the Darling Fault Zone, accompanied by medium pressure, amphibolite facies metamorphism (Wilde, 1990).

There are also a number of small bodies of quartz-poor granitoids of dioritic, monzonitic and syenitic affinity within the granite batholiths. More extensive areas of quartz monzonite occur south of Darkan (Fig. 1) and these are rich in amphibolite xenoliths. A distinctive, tectonised quartz monzonite (the Gibralter Quartz Monzonite) forms a narrow, discontinuous zone along the eastern boundary of the Balingup Metamorphic Belt (Wilde and Walker, 1982 and 1984) in association with migmatite.

5.3.2 Geology - Site

The site is located on the dissected Darling Plateau. The locality consists of an elongate narrow plateau remnant that runs north west along the ridge line in the west, at an elevation of 280 metres AHD ranging down to about 240 metres in the north west.

The general area is located in a drainage basin of the Avon River system and geologically, is are part of the Pre-Cambrian meta sedimentary complex which is known as the Jimperding Metamorphic Belt. The Jimperding Metamorphic Belt Series extends as a 120 kilometre long belt in a north-westerly direction from York to Clackline and from there to Jimperding and then Chittering, where it becomes the higher grade metamorphic Chittering Metamorphic Belt.

Williamson's Pit is located on the crest of a hill, at an elevation of about 290 metres AHD.

To the west of the pit the land is gently undulating before sloping relatively uniformly to the river flat. To the immediate east of the pit the land slopes gently down to a small drainage line (draining from south to north) at about 280 metres and from there the land slopes gently upwards to about 330 metres.

The Jimperding Series consists of inter-bedded schists, quartzites and minor metamorphosed volcanics. They are steeply dipping and trend northerly and then north-westerly. However under the void only weathered schists are encountered, because these are the only parts of the regolith that are suitable for brick manufacture.

The area to be filled is a void cut into deep micaceous clays formed from the weathering of schists of the Jimperding Metamorphic Belt. The rocks are predominantly weathered andalusite and kaolin-quartz-mica schists that are near vertical and striking generally north. These schists have been subjected to a long period of weathering, in the Mesozoic - Cainozoic, to produce the laterite erosion surface, of which a remnant caps the nearby hills.

A number of hydrothermal quartz veins intersect the exposed geological sequences, presumably intruded along fracture lines. The quartz veins are either massive white quartz veins or a reddish coloured quart which has been fractured, presumably due to earlier metamorphic events, These older quartz veins tend to have the fractures infilled with a clay/silt matrix.

Weathering of the rocks is deep, and, from a drilling program conducted by Austral Brick, shows the depth of weathering as over 30 metres. The base of the weathered material was not found because the clay quality reduced with depth and drilling was stopped.

Williamson's Pit is located in an area of micaceous silty clay which becomes fresher with depth and shows some laterisation. Clayey sands are present in small amounts.

Only clays suitable for brick making are excavated.

5.3.3 Soils

The soils which overlay the weathered schists (clay) belong to the Yalanbee and Leaver soil landscape units. In the vicinity of Williamson's Pit is a yellow gravelly loamy sand and loam which overlies sandy clay at a depth of about 0.5 metres.

6 SITE HYDROGEOLOGY

6.1 Regional Hydrogeology – Previous Investigations

The local hydrogeology has been characterised from an interpretation of the exploration drilling undertaken by Austral Brick and hydrogeological studies completed by Martinick McNulty in 1998.

On 24 March 1998 ten holes were drilled by Wallis Drilling with a Mantis drilling rig which was mounted on a Toyota Landcruiser, to assess the local geology and groundwater conditions.

Water was generally not encountered during drilling, with the exception of some holes which are located approximately 1 kilometre to the northwest of the pit. In these holes granite was intersected and water was found to be present in weathered basement.

Hydraulic testing of all of the monitoring bores (WF 1 to WF 11) was undertaken by Martinick McNaulty to determine the in-situ hydraulic properties of the schistose clay. Testing comprised injection of a known volume of water into the bore and subsequently monitoring the rate at which the water level declined. Analysis of the response was completed using the Bower and Rice method.

From the results of the hydraulic testing it was concluded by Martinick McNulty, that the schistose clay present in the pit and its vicinity has a low to very low permeability and that the groundwater regime in that area is classified as an aquiturd/aquiclude. That is to say, although groundwater is present there is no defined aquifer system. The sandy clays are partially saturated and the local groundwater levels and vary with changes in topography.

6.1.1 Permeability

Six piezometers were installed by Martinick/McNulty around the perimeter and another four within the clay pit at that time. Whilst the clay pit has been enlarged in the past decade, the results provide a good indication of the geotechnical properties of the weathered schist.

In each piezometer a PVC standpipe of 50 millimetre diameter was installed immediately after the hole was drilled. The casing was slotted for the entire depth of the hole and all of the piezometers were surveyed by Scanlan Surveying in May 1998. A summary of monitoring bore details is provided in Table 3 (Martinick McNaulty 2002).

Two clay samples were collected by Martinick/McNaulty from the floor of Williamson's Pit adjacent to bores WF2 and WF4. These samples were analysed for particle size distribution, optimal moisture content for compaction and permeability of the compacted clay.

Table 3 Permeability Testing (Martinick McNaulty 1998)

Drill Hole	East	North	Top of Casing	SWL mAHD	Permeability m/d	Permeability m/s
WF1	449865	6449588	88.41	81.91	0.0164	1.1 x 10-7
WF2	449915	6495825	89.2	81.69	0.0041	4.7 x 10-8
WF3	449761	6495895	82.07	80.71	0.0037	4.2 x 10-8
WF4	449870	6495734	86	81.2	0.0064	7.4 x 10-8
WF5	449756	6496127	85.5	80.49	0.038	4.4 x 10-7
WF6	49956 6	495896	99.57	85.3	0.00034	3.0 x 10-9
WF7	449845	6495626	86.37	80.99	0.0017	1.9 x 10-8
WF9	449658	6495750	90.5	86.89	0.006	6.9 x 10-8
WF10	0449632	6495903	86.44	83.90	0.0030	3.4 x 10-8
WF11	1449606	6495610	84.62	80.88	0.0204	2.4 x 10-7

The distribution of particle sizes demonstrated that the material in Williamson's Pit consists of a clayey silty sand with minor gravel. The clay content varies from 4 to 8%, the silt content varies from 26% to 33% silt, and the sand content varies from 53 to 56%.

The falling head permeability tests for samples compacted to 90% standard compaction at optimal moisture content, gave coefficients of permeability of $3.12xI0^{-9}$ and $1.49x10^{-8}$ metres per second respectively for WF2 and WF4. The compaction tests indicate that maximum dry densities of 1.87 and 1.74 tonnes per cubic metre at optimum moisture contents of 13% and 17% could be achieved for the material obtained from WF2 and WF4, respectively.

The above tests indicate that the clay can be used as landfill liner material, if compacted.

6.2 REGIONAL GROUNDWATER QUALITY

The regional groundwater quality is highly variable, with water quality ranging from 500 mg/l as TDS to 3000 mg/l TDS. Ground water tends to be slightly acidic with pH in the range of 4 to 5 not uncommon.

7 MONITORING BORE INSTALLATION

Drilling at the site commenced in June 2011 and was completed in 5 days. Further installation of monitoring bores was required as the outcome of the SAT process in 2013, and a further 5 monitoring bores were installed in April 2013. All fieldwork undertaken, including a summary of the investigation methodology utilised is summarised in the following sections in chronological order.

7.1 LOCATION OF GROUNDWATER MONITOR WELLS

7.1.1 Previously Installed Monitor Wells

No previously installed wells (pre 2011) were observed at on site. Wells drilled for previous investigations have been decommissioned or were unusable. Other bores in the general area to 2 km radius, registered with Department of Water are shown below. No registered bores are located within a radius of 2 km from the site. The nearest bore is located 2.2 km up hydraulic groundwater gradient, to the east of the site.

7.1.2 Monitor Well Site Selection

Nine new groundwater monitor wells (designated SE-1 to SE-9) were installed at the site during this investigation. The locations for these wells were selected after an evaluation of the regional groundwater flow direction (previous groundwater monitoring).

Monitor wells SE-1 to SE-3 were installed within the south-western areas. Monitor well SE-4 targeted the aquifer up-hydraulic gradient boundaries of the site. Monitoring bores SE 5 and SE 6 targeted the south and south east side of the pit edge, while monitoring bores SE 7, and SE 8 the north and north western edges. Monitoring bore SE 9 was installed to record the far western side of the proposed development.

Prior to the commencement of drilling activities, all services within the site area were identified and located to prevent potential damage. Accurate locations of the nine newly installed monitoring bores are shown on Figure 6.

7.1.3 Drilling

The nine monitor wells (SE1 to SE9) were installed by Mick Lewis Drilling under supervision by Stass Environmental using the down hole hammer rotary drilling technique (refer Appendix B, Photographs 1). At all drilling locations, natural clays and muscovite schists were encountered throughout the entire profile therefore allowing trouble free well completion.

Drilling locations SE 1 to SE 9

- After positioning the drill rig, 150mm diameter holes were drilled to approximately 50 to 60m.

- The casing was inserted and sand packed to one metre above the slotted interval (see Figure 8 to 17).
- Bentonite pellets were placed immediately above the sand packing and measured with a weighted tape until a one metre thick seal was formed.
- The annulus of the hole was backfilled with local drilled materials mixed with cement grout to the ground surface and sealed with bentonite at the ground surface to prevent surface water leakage to groundwater. A cement pad measuring 300mm from the centre of the bore annulus was also placed to further reduce the potential for surface waters to short circuit down the bore annulus.

Steel protective surface covers, protruding approximately 600mm above the ground surface were also installed over all PVC casings and lockable with padlocks. Monitor well logs and construction diagrams are contained within Appendix B.

Five in-pit bores were also installed to a depth of approximately 10 m, to monitor any sub-surface waters within the pit (again, as part of the SAT outcome).

7.1.4 Development

Immediately following well installation, monitor wells SE-1 SE 9 were developed to remove sediment initially using compressed air from the drill rig and later an electric submersible pump (Grundfoss MP1 and other electric pumps).

7.1.5 Position and level survey

A position and level survey was undertaken by a licensed surveyor to determine Australian Map Grid (AMG) coordinates and Australian Height Datum (AHD) elevations of each monitor well casing including the wells from 2011 installation and newly installed monitor well (2013). During the level survey, elevations of each monitor well were obtained from the highest point on the bore protective cover opening, which was also permanently marked for future reference. These reference points were used during the collection of water levels as described in Section 7.6. The results of this position and level survey are shown below:

Table 4 MONITOR WELL SURVEY DATA

Monitor Well	Easting (mAMG)	Northing (mAMG)	PVC Casing Elevation (mAHD)	Descriptive Location
SE1	6495635.67	449807.22	274.4	Close to drainage line
SE2	6495913.67	449616.1	285.58	Along the downgrad. Road
SE3	6496193.89	449382.97	291.64	Along the downgrad. Road
SE4	6495785.76	450377.9	299.86	Upstream of quarry
SE 5	6495858.19	449809.33	280.553	South edge of pit
SE 6	6495855.09	450039.37	286.78	East edge of pit
SE 7	6496095.83	450043.12	289.08	North edge of pit
SE 8	6496172.63	449770.44	292.86	North east of pit
SE 9	6496373.32	449643.15	278.62	Far north east of pit
pit 1	6496054.74	449813.3	274.89	In pit shallow bore
pit 2	6496122.84	449804.3	274.4	In pit shallow bore
pit 3	6496067.8	449783.51	285.58	In pit shallow bore
pit 4	6496037.54	449911.15	291.64	In pit shallow bore
pit 5	6495948.38	449707.85	299.86	In pit shallow bore

Note: mAHD – metres above Australian Height Datum

mAMG – metres relative to Australian Map Grid

All positions were determined by a licensed surveyor using a differential GPS instrumentation, calibrated to within +/- 2m accuracy. AHD elevations were surveyed to +/- 1mm. These levels of accuracy are judged to be within the requirements of this study.

Photo plate 1 - Drill cuttings sampled at 1 m intervals. Water struck at 39 m depth.

Photo plate 2 - cuttings sampled at 1 m intervals. Water struck at 44 m depth.

7.2 Water Level Measurement

Water levels were measured in all monitor wells on-site prior to the purging and sampling of each well (described earlier in Section 7). These levels were assessed to be suitable for hydrogeological interpretation. The highest of these levels, measured quarterly between 2011 and 2014 reduced to AHD using the level survey data are shown in Table 5 below.

Table 5 Highest water levels 2011 to 2014

Monitor Well	Easting (mAMG)	Northing (mAMG)	Highest Water Elevation (mAHD)
SE1	6495636	449807.2	267.868
SE2	6495914	449616.1	272.46
SE3	6496194	449383	273.94

7.2.1 Purging and Sampling

Groundwater samples were obtained from a total of 4 locations on and around the site from the 9 new monitoring wells. Prior to sampling, each monitor well was purged at a rate of

approximately 5 L/min using a decontaminated submersible pump for a minimum of 15 minutes (i.e. purge volume of greater than 75L).

Groundwater samples were collected in laboratory supplied and preservative treated containers from each monitor well after withdrawing the submersible pump. Groundwater samples were collected in accordance with AS 5667.1:1998 . All samples were stored on ice and transported MGT Eurofins laboratories in Melbourne for analysis with appropriate chain-of-custody documentation. In addition, one duplicate sample was obtained at each monitoring event and submitted for quality control purposes.

The laboratory certificates of all of these analyses are provided in the Appendix D.

7.2.2 Field Water Quality Data

Water quality of the groundwater samples was tested in the field. The following table presents the average results over the period 2011 to 2014:

Table 6 Average of the field water quality record (June 2011 to October 2014)

Bore ID	pH	Elect. Cond Us/cm	TDS ppm
SE 1	3.7	3744	1886
SE 2	4.45	7536	3904
SE 3	6.9	8640	4490
SE 4	5.8	488	257
SE 5	4.9	4188	2326
SE 6	4.4	6936	3415
SE 7	3.7	10628	4836
SE 8	6.01	692	346
SE 9	5.2	12854	981

Field water quality records were recorded at all bores, from SE-1 to SE-9 between March 2013 and October 2014. Previous to that bores SE-1 to SE-4 were sampled when installed in 2011 and then again quarterly to 2014.

It is apparent from the field water quality results that two different groundwater aquifers have been intersected by the 9 bores installed around the site. Bores SE-1, SE-2, SE-3, SE-5, SE-6 and SE-7 report poor water quality of brackish nature, whereas bores SE-4, SE-8 and SE-9, which are located to the east and north of the site report relatively fresh water conditions.

The field water quality records for pH, electrical conductivity and field salinity testing are provided in Tables 7 to 9. It is worth noting that while most of the bores presented a relatively steady water quality, the variation in both pH and EC at bore SE 9 was at times significant, with salinity increasing with reduction in acidity (rise in pH) of the groundwater.

8 LABORATORY ANALYSIS

8.1 Analytes

All groundwater and quality control samples were analysed using National Association of Testing Authorities (NATA) registered methods and analytical techniques for the following determinants.

- Major anions and cations, pH, conductivity, ammoniacal nitrogen and total dissolved solids (TDS);
- Heavy metals including arsenic, cadmium, chromium, copper, nickel, lead, zinc and mercury;

The chain-of-custody documentation and analytical data as presented by the laboratories appears within Appendix D.

8.2 Quality Control

The following sections describe the testing methodologies and quality assurance/quality control (QA/QC) procedures used for analysis of the water samples obtained during the field activities.

8.3 Field Duplicates and Blank Samples

One field blank sample (designated SE-5) was obtained. The results of the field duplicate and blank analyses are included in the Appendix D.

The Relative Percentage Difference (RPD) values calculated for the duplicated groundwater analysis ranged from incalculable where results were below laboratory practical quantitation limits (PQLs).

Analysis of the blank groundwater sample (designated SE 5) reported concentrations below the respective practical quantization limits (PQLs). Expected background concentrations were reported for major anions, cations and the heavy metals analyses conducted.

8.4 Laboratory Control Samples, Spike Recoveries, Duplicates and Blanks

Laboratory control and spiked samples were analysed by ARL and MGT Eurofins for all analytes (where applicable). All recovery results were within recommended control limits, indicating the results of the sample analyses are adequate for the purposes of this report, with a general tendency to slightly overestimate the concentrations of each individual analyte. All laboratory blank samples reported concentrations less than the PQL.

Laboratory duplicate analysis was conducted for heavy metals, cations, anions, ammoniacal nitrogen and total nitrogen. All RPDs were well within acceptable limits.

9 GROUNDWATER QUALITY

The groundwater analytical results are summarised in Appendix C. Based on the analytical results obtained, the following conclusions can be derived.

9.1 Major Ions and Groundwater Parameters

Analysis of groundwater samples reported all major ions and parameters

9.2 Heavy Metals

Analysis of most of downgradient and upgradient groundwater reported dissolved heavy metal concentrations above the DEC (2010) fresh water guidelines. Bores SE-4, SE-8 and SE-9 are located north and east of the proposed landfill and water within these bores is characterised by relatively low salinity (ranging some 200 to 1000 mg/l as TDS), the absence of heavy metals (arsenic, cadmium, copper, nickel, lead and zinc) and moderate pH (close to neutral). In general, the water quality to the north and east of the proposed landfill can be described as relatively good.

To the south and west of the site, the groundwater displays poor water quality. The water is brackish with TDS ranging from 2000mg/l to over 6000 mg/l. Heavy metals are present for all sampling events, with nickel being the main heavy metal of concern as the concentrations of this water quality variable have in the past been in the order of 200 times over the drinking water guidelines. Lead and copper are also prevalent, with occasional presence of small amounts of cadmium and arsenic. Table 10 presents water quality analyses from the most recent sampling event in September 2014. These analyses can be considered as representative of all other sampling events.

Summaries of the water quality in the bores are presented in Appendix C.

9.3 Nitrate

Unlike with the heavy metals, nitrate (or other nitrogen species) is not present in the groundwaters to the south and west of the proposed site, but is present to the north and east. This is most likely as a consequence of land use - the land is stocked with sheep.

The water quality with respect to all the nitrogen species complies with DER water quality guidelines for drinking water.

10 GROUNDWATER CONDITIONS

10.1 Groundwater Hydraulics

Regional ground water was inferred to be flowing in a south to south-westerly direction south of the site and north-westerly, north of the site. This observation is based on the measured depth to groundwater in each monitor well and the results of the level survey. Figure 4 illustrates the direction of groundwater flow based on lines of equal potential derived from the groundwater elevation in each monitor well (Section 7).

Ground water (as a deep confined aquifer) appears to exist underneath the whole of the proposed landfill. Ground water arrives from the east and the predominant flow direction from the proposed landfill site is to the south and north west, with a relatively steep hydraulic gradient of approximately 0.03, when calculated with respect to a closest potential groundwater pathway to the Jimperding Brook. The site sits on a topographical saddle which is also reflected in the groundwater potentiometric surface morphology.

10.2 Conceptual Hydrogeological Model

A conceptual groundwater model has been derived from a review of previous reports relating to the drilling, and the recent installation of piezometers in the area.

Figure 7 illustrates the major features of the conceptual hydrogeological model of the quarry area and surrounds. The major elements of the model are:

- The local geology is characterised by weathered micaceous schists with steep paleo-bedding which strikes northwards. The weathered zone above fresh bedrock extends to between 40 and 50m. This zone is primarily a white silty/clay with inclusions of quartzite, mica and is criss-crossed by a number of hydrothermal quartz veins. No local faulting has been observed from aerial photography nor is reported in geological maps of the area.
- Recharge to the local aquifers is likely to be from zones to the east, potentially a long distance away. Local geology is of very low permeability and is unlikely to provide rainfall recharge of any magnitude. The closest groundwater discharge to the site is the Jimperding Brook, located about 1 km to the south of the site.
- The upper 10 to 15 m of this weathered zone is mined for clay. Below this level the clay becomes saline and is no longer suitable for brick and tile production.
- The aquifer/aquitard has a steep groundwater gradient with respect to Jimperding Brook (0.03). Seasonal groundwater level fluctuations over the site are in the order of 0.5 to 1.2 m.
- The aquifer/aquitard which is located in weathered micaceous schists at depth and is confined by between 30 and 50 m thick bed of weathered micaceous to gritty silt/clays, from the ground surface (see Figure 7). This indicates that the aquifer/aquitard is

separated from the surface by some 30m (in the east) to 50m (in the west) of clay beds. This was borne out during the drilling of the monitor wells (see geological logs of SE-1 to SE-9), as groundwater strikes were all well below the current potentiometric surface. This also shows that the depth to groundwater aquifers/aquitards increases westwards.

- It is concluded that this is a deep sitting confined aquifer/aquitard, with relatively poor water yield.
- Significant upward piezometric pressure due to confinement by clay rich stratigraphy and steep aquifer gradient.
- Stabilised potentiometric head relatively close to the surface (within 10 to 20 m from the natural ground surface). Potentiometric head is the result of the confining pressure at the aquifer level. Lateral groundwater flow is likely to be restricted by the clay rich mineralisation, resulting in poor transmissivity. This was shown by the relatively long time (up to 2 days) it took the monitoring bores to stabilise a SWL after drilling was completed (see cross sections in DWG OV-03-ACW and site plan in DWG OV-02-ACW)
- Ground water chemistry recorded for the period July 2011 to September 2014 shows that the waters south and south-west of the site are not fit for human consumption. Ground water to the east and north east of the site is of good quality.
- The potential primary beneficial use of groundwater in proximity to the site is (i) aquatic environment in the Jimperding Brook 900 m to the south and south-west, (ii) stock watering from the Jimperding Brook, (iii) possible future groundwater abstraction at residences to the north, potentially for domestic purposes (see DWG OV-01- ACW).

Geological logs for the bores drilled during June 2011 and April 2013 are shown in Figures 8 to 16.

10.3 Groundwater flow

The potentiometric groundwater surface elevation is shown in Figure 4 and the aquifer/aquitard location is derived from the water strikes recorded during drilling of the monitoring bores. Figure 4 is generated from the highest recorded water levels over the period July 2011 to September 2014 at each of the monitoring wells.

The local land gradient is towards the south and north-west from the site, but the groundwater flow direction is recorded to the south, calculated from the potentiometric isoclines. This flow direction is used in the risk assessment for impact on potential receptors, as Jimperding Brook is the closet potential receptor to the site (912 m south). An assumption is made that a preferential groundwater flow path to the receptor exists directly south to Jimperding Brook.

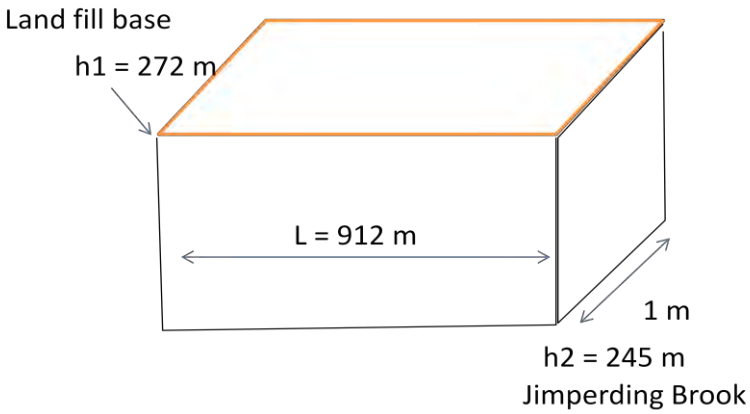
10.3.1 Direct Calculation for Travel Time from Proposed Landfill to Jimperding Brook:

An assumed hydrogeological connection between the site and Jimperding Brook is used to provide a worst case scenario for contamination impact of a sensitive receptor.

The receptor pathway would be along a quartzite geological structure which would allow groundwater flow from below the proposed landfill and be intercepted by the base flow of the Jimperding Brook.

The following model calculation seeks to provide the time period that a contaminant would take to reach the Brook, under purely advective groundwater flow conditions.

- Hydraulic conductivity through a fractured quartzite with a silt matrix - 0.08m/d (Freeze & Cherry, 1979)
- Porosity - 10%. While clay may have porosities in the order of 40%, silt is more likely to be in the 10% range.
- Gradient - 0.03 from the conceptualization below:



Not to scale

Calculation

Darcy's law is the basic equation that describes fluid flow through porous media. There are many ways to write Darcy's Law, and a few of them will be presented here. The first equation contains a velocity term, v (L/T), a conductivity term, K (L/T), a head term, h (L), and a distance term, l (L):

$v = -K(\Delta h/\Delta l)$

L =912m K = 1×10^{-6} m/s Porosity = 10% or 0.1

A = $1 \times 27 = 27m^2$ $dh = (h_2 - h_1) = (272 - 245) = -27$ m

therefore,

$i = (27)/912 = -0.0296 = -0.03$

$v = - (10^{-6}) \times (-0.03) = 3 \times 10^{-8}$ m/s

$Q = - (10^{-6}) \times (-0.03) \times 27 = 0.81 \times 10^{-7}$ m^3/s

Note: To Calculate Average Linear Velocity which is what we use for groundwater calculations you must divide v by porosity.

Average Linear Velocity

v/porosity = $3 \times 10^{-8} / 0.1 = 3 \times 10^{-7}$ m/s

Therefore daily travel distance = $3 \times 10^{-7} \times 86{,}400 = 0.026$ m/day

and in a year, $0.026 \times 365 = 9.5$ m/year

To cover the full distance (912 m) it will take groundwater 96 years to reach Jimperding Brook.

NOTE:

Hydraulic conductivity assumed to be that of silt (0.08 m/day), which is worst case scenario, as the lithological material matrix is a silt-clay mix, which could be considered less permeable.

No dispersion or other solute transport assumptions taken into account.

10.3.2 Bioscreen Modelling

Bioscreen is a screening model which simulates a contaminant plume. It is programmed in Microsoft® Excel, is based on the Domenico analytical solute transport model, and has the ability to simulate advection, dispersion and adsorption. For the purposes of this report, a solute transport without decay model was used.

Bioscreen was run for a period of 10 years to determine which contaminants were likely to reach the closest sensitive receptor (Jimperding Brook) at concentrations above the guideline values. A cross sectional area was estimated for the plume using the flow rate from the base of the landfill and the calculated seepage velocity. Flow rate was assumed to be conserved.

As an assumption was taken that a conservative contaminant (non-decay) at a concentration of 600 mg/l (say chloride) will leave the landfill through a 50 m wide and 2 m deep saturated contact zone (approximately 200 litres/day for the whole landfill site). This would be roughly equivalent to a loss of 10l/day/ha over the Stage 1 of the landfill. The Bioscreen input and output screens are provided over the next 3 pages.

The Bioscreen modelling results indicated that after 10 years the closest impact would be about 400 m downgradient of the site, with a total plume mass of some 38 kgs with concentrations of an arbitrary conservative contaminant reduced from 600 mg/l to less than 50 mg/l.

The Bioscreen model calculations use dispersion in addition to advection of a conservative contaminant, which allows for solute transport to be faster than by purely advective flow of groundwater (previous calculation). These calculations show that the first "breakthrough" of contamination to the Brook is possible within 17 years of the landfill developing a leak.

11 CONCLUSIONS

On the basis of this study, the following conclusions are reached:

- The site is underlain by a confined aquifer/aquitard of limited extent which is confined by thick beds (up to 30 m thick) of clays and weathered schist/quartzite.
- Based on the water yield and aquifer physical characteristics, the water body can be defined as a confined aquitard.
- The water quality in south and south west downgradient bores is poor, indicating impacts from salinity and geological weathering of in situ mineralisation (presence of heavy metals). Ground water quality to the north and east of the site is good.
- While the yield from the aquifer has not been tested, the geological materials recovered from the drilling suggest that this aquifer is potentially low yielding with poor aquifer transmissivity (low hydraulic conductivity).
- The recently installed bores are adequately located to define the local aquifers and are suitably positioned for monitoring of the groundwater below the site.
- The highest possible groundwater potentiometric surface (measured between July 2011 and September 2014) is below the current floor of the pit.
- The groundwater conditions at the site are favorable for the development of a waste management facility as the aquifer below and adjacent to the site cannot be considered a beneficial water resource due to likely low yielding water characteristics and in some locations poor water quality. This observation is related to the significant clay content in the matrix of the geologic materials recorded during installation of the site groundwater monitoring bores.
- Modelling of the most sensitive receptor pathways shows that it will take in excess of 90 years for water leaking from the landfill to reach the most sensitive and closest receptor - the Jimperding Brook. The Bioscreen model suggests that it may take as little as 17 years for a contaminant "breakthrough" to be observed at the Brook (first recorded concentration) if a preferential groundwater flow path exists in a direct line between the landfill and Jimperding Brook

- The beneficial groundwater use in the area is considered to be sufficient for “stock watering”. Groundwater to ten east and north of the site is suitable for domestic use.
- Water yields from bores adjacent to the site are likely to be poor due to the low permeability of the aquifer/aquitard.

12 RECOMMENDATIONS

The following recommendations are made, based on the investigations to date:

- As the downgradient groundwater quality exceeds the DER guidelines for fresh waters, it is recommended that the baseline water quality survey data is used as water quality triggers. If required, these water quality analyses can be performed again to confirm the water quality data base currently available.
- Static water level (SWL) and quality of the groundwater should be continue to be monitored at a quarterly interval.

14 GLOSSARY OF TERMS

Abstraction Pumping groundwater from an aquifer.

AHD Australian Height Datum; equivalent to: Mean Sea Level (MSL) + 0.026 m; Low Water Mark Fremantle (LWMF) + 0.756 m.

Alluvium Unconsolidated sediments transported by streams and rivers and deposited.

AMG Australian Map Grid.

Anticline Sedimentary strata folded in an arch.

Aquifer A geological formation or group of formations able to receive, store and transmit significant quantities of water.

Confined A permeable bed saturated with water and lying between an upper and a lower confining layer of low permeability.

Baseflow Portion of river and stream flow coming from groundwater discharge.

Basement Competent rock formations underneath sediments.

Bore Small diameter well, usually drilled with machinery.

bns Below natural surface.

Colluvium Material transported by gravity downhill of slopes.

Confining bed Sedimentary bed of very low hydraulic conductivity.

Conformably Sediments deposited in a continuous sequence without a break.

Conductivity The flow through a unit cross sectional area of an aquifer under a unit hydraulic gradient.

Dewatering Abstraction of groundwater from bores to assist in mining.

Evapotranspiration A collective term for evaporation and transpiration.

Gradient The rate of change of total head per unit distance of flow at a given point and in a given direction.

Head The height of the free surface of a body of water above a given subsurface point.

Hydraulic Pertaining to groundwater motion.

Flux Flow.

Fault A fracture in rocks or sediments along which there has been an observable displacement.

Formation A group of rocks or sediments which have certain characteristics in common, were deposited about the same geological period, and which constitute a convenient unit for description.

Porosity The ratio of the volume of void spaces, to the total volume of a rock matrix.

Potentiometric An imaginary surface representing the total head of groundwater and defined by the level to which water will rise in a bore.

Specific yield The volume of water than an unconfined aquifer releases from storage per unit surface area of the surface.

Semi-confined A semi-confined or a leaky aquifer is saturated and bounded above by a semi-permeable layer and below by a layer that is either impermeable or semi-permeable.

Semi-unconfined Intermediate between semi confined and unconfined, when the upper semi-permeable layer easily transmits water.

Unconfined A permeable bed only partially filled water and overlying a relatively impermeable layer. Its upper boundary is formed by a free watertable or phreatic level under atmospheric pressure.

Transmissivity The rate at which water is transmitted through a unit width of an aquifer under a unit hydraulic gradient.

Transpiration The loss of water vapour from a plant, mainly through the leaves.

Watertable The surface of a body of unconfined groundwater at which the pressure is equal to that of the atmosphere.

Well Large diameter bore, usually dug by hand.

15 LIMITATIONS

1. The conclusions presented in this report are relevant to the condition of the site and the state of legislation currently enacted as at the date of this report. We do not make any representation or warranty that the conclusions in this report will be applicable in the future as there may be changes in the condition of the site, applicable legislation or other factors that would affect the conclusions contained in this report.

2. Stass Environmental has used a degree of skill and care ordinarily exercised by reputable members of our profession practicing in the same or similar locality. Conclusions are based on representative samples or locations at the site, the intensity of those samples being in accordance with the usual levels of testing carried out for this type of investigation. Due to the inherent variability in natural soils we cannot warrant that the whole overall condition of the site is identical or substantially similar to the representative samples.

3. This report has been prepared for Opal Vale and for the specific purpose to which it refers. No responsibility is accepted to any third party and neither the whole of the report or any part or reference thereto may be published in any document, statement or circular nor in any communication with third parties without our prior written approval of the form and context in which it will appear.

4. This report and the information contained in it is the intellectual property of Stass Environmental. Opal Vale is granted an exclusive licence for the use of the report for the purpose described in the report.

RESOURCE POTENTIAL FOR LAND USE PLANNING

TOODYAY AREA

Rock types	Mineral potential	Regional planning implications
Sedimentary rocks of the Perth Basin		
Granitic rock	Low for gold, high for dimension stone	
Granite, gneiss, migmatite	Unknown	
Schist, granofels	High for industrial minerals (sillimanite, kyanite, graphite)	
Calc-silicate gneiss, mylonite	High for base and other metals (copper, zinc, and lead)	
Banded iron-formation, metamorphosed	High for iron ore	
Quartzite	High for construction materials (crushed rock) and building stone	
Felsic volcanic rock, metamorphosed	High for gold and base metals	
Mafic volcanic rock, metamorphosed	Very high for gold	
Altered mafic intrusive to volcanic rock, metamorphosed	Very high for gold	
Mafic to ultramafic rock, metamorphosed	Very high for platinum group metals and steel industry metals	

Overlying weathered materials (widespread but not shown on map)

Laterite; widespread on hills	Very high for bauxite, gold, and ironstone gravel
Alluvial and eolian sand; in valleys	Very high for construction sands

Mineral occurrences, deposits, and mines by groups	Resource
Precious metal	Gold (Au), platinum-group metals (PGE)
Steel industry metal	Vanadium (V), molybdenum (Mo)
Specialty metal	Heavy mineral sands (zircon and titanium minerals)
Iron	Iron ore
Alumina	Bauxite
Industrial mineral	Ilmenite (Ilm), glauconite (Glt), kyanite (Ky), sillimanite (Sil), silica sand (Sisd), kaolin (Kln), mica, talc
Construction material	Unspecified unless indicated; rock, sand, gravel, clay (Cy), quartzite as dimension stone (Qtze)

Figure 14 - Geological and construction log of Bore SE 7

Stass Environmental

Coords: 449770.44 East by 6496172.63 North, RL 278.62 mAHD

Drill Rig: Mick Lewis Drilling DHH	Date Drilled: 19 March 2013	Logged By: N Grobler
Boring Dia: DHH 150 mm	Boring Number: Bore SE 8	

Sample	Casing Type	Completion	SWL Metres	Depth Meters	Lithology	Description
	Surface Blank Casing Gravel and cement grout packed 1 m bentonite clay seal Slotted Casing	 Cap at base		6 12 18 24 30 36 42 48 54 58		Creamy dusty sand, very little mica Fine white clayey and increased mica cuttings. Static water level at 7.700 m below the surface (measured 2 days after drilling) Brown to cream clay cuttings, 20% mica Creamy coloured sand with some moica cuttings. Water strike at 17.00 below the surface Pink medium grained mica and clay cuttings.

Completion Notes:

Piezometer SE 8

Class 12, 55 mm blank PVC casing from 0 to 12 mbgs;
Class 12, 55 mm, slotted, PVC casing from 12 to 18 mbgs
1 m bentonite seal above slotted casing;

Colar is set at 0.65 m above g.s.

Water field quality:pH = 6.59, EC =1583 uS/cm, TDS 792 mg/l
REDOX = 76.3 mV

Piezometer was capped at base.

Site:

Opalvale Clay Quarry
11 Chitty Road
Toodyay

Project No.: Ovale001

Drill Rig: Mick Lewis Drilling DHH	Date Drilled: 19 March 2013	Logged By: N Grobler
Boring Dia: DHH 150 mm	Boring Number: Bore SE 9	

Sample	Casing Type	Completion	SWL Metres	Depth Meters	Lithology	Description
	Surface Blank Casing Gravel and cement grout packed 1 m bentonite clay seal Slotted Casing	 Cap at base		6 12 18 24 30 36 42 48 54 58		Medium grained brown sand, clay and some mica Static water level at 5.200 m below the surface (measured 2 days after drilling) Cream to white clay cuttings, a lot of mica Dark brown cuttings, clay and lot of mica cuttings. Water strike at 14.00 below the surface Creamy clay, wet.

Completion Notes:

Piezometer SE 9

Class 12, 55 mm blank PVC casing from 0 to 12 mbgs;
Class 12, 55 mm, slotted, PVC casing from 12 to 18 mbgs
1 m bentonite seal above slotted casing;

Colar is set at 0.65 m above g.s.

Water field quality:pH = 6.23, EC =630 uS/cm, TDS 315 mg/l
REDOX = 21.2 mV

Piezometer was capped at base.

LABORATORY REPORT

ARL Lab No: 11-4452
Date: 25 July 2011

CLIENT: Stass Environmental
PO Box 11
KALAMUNDA WA 6926

ATTENTION: Andre Stasikowski

SAMPLE DESCRIPTION: Five water samples as received for analysis of conductivity, total nitrogen, pH, total dissolved solids and metals.

DATE RECEIVED: 06 July 2011

LOCATION / JOB NO: OV01 - Opalvale CHITTY

PURCHASE ORDER: NA

METHOD REFERENCES:

pH in Water	ARL No. 014
Total Dissolved Solids in Water	ARL No. 017
Conductivity and Salinity in Water	ARL No. 019
Metals in Water	ARL No. 402, 403
Total Nitrogen	ARL No. 330

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

Description	Testing Site	Extracted	Holding Time
Chloride	Melbourne	Jul 25, 2013	28 Day
- Method: MGT 1100A			
Conductivity (at 25°C)	Melbourne	Jul 25, 2013	28 Day
- Method: APHA 2510 Conductivity by Direct Measurement			
pH	Melbourne	Jul 25, 2013	0 Hours
- Method: APHA 4500 pH by Direct Measurement - ** Samples analysed outside holding time. Analysis should be performed in situ. Results for reference only.			
Sulphate (as S)	Melbourne	Jul 25, 2013	28 Day
- Method: In house MGT1110A (SO4 by Discrete Analyser)			
Total Dissolved Solids	Melbourne	Jul 31, 2013	7 Day
- Method: APHA 2540C Total Dissolved Solids			
Total Nitrogen Set (as N)			
Nitrate & Nitrite (as N)	Melbourne	Jul 25, 2013	28 Day
- Method: APHA 4500-NO3/NO2 Nitrate-Nitrite Nitrogen by FIA			
Total Kjeldahl Nitrogen (as N)	Melbourne	Jul 25, 2013	7 Day
- Method: APHA 4500 TKN			
Heavy Metals (filtered)	Melbourne	Jul 25, 2013	180 Day
- Method: USEPA 6020 Heavy Metals			
Mobil Metals : Metals M15	Melbourne	Jul 25, 2013	28 Day
- Method: USEPA 6010/6020 Heavy Metals & USEPA 7470/71 Mercury			
Alkali Metals	Melbourne	Jul 25, 2013	180 Day
- Method: USEPA 6010 Alkali Metals

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per Kilogram

mg/l: milligrams per litre

ug/l: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100ml: Organisms per 100 millilitres

NTU: Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

TERMS

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environment Protection Authority
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within

QC - ACCEPTANCE CRITERIA

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Chloride	Melbourne	Dec 06, 2013	28 Day
- Method: MGT 1100A			
Conductivity (at 25°C)	Melbourne	Dec 09, 2013	28 Day
- Method: APHA 2510 Conductivity by Direct Measurement			
pH	Melbourne	Dec 06, 2013	0 Hours
- Method: APHA 4500 pH by Direct Measurement - ** Samples analysed outside holding time. Analysis should be performed in situ. Results for reference only.			
Sulphate (as S)	Melbourne	Dec 06, 2013	28 Day
- Method: In house MGT1110A (SO4 by Discrete Analyser)			
Total Dissolved Solids	Melbourne	Dec 10, 2013	7 Day
- Method: APHA 2540C Total Dissolved Solids			
Total Nitrogen Set (as N)			
Nitrate & Nitrite (as N)	Melbourne	Dec 06, 2013	28 Day
- Method: APHA 4500-NO3/NO2 Nitrate-Nitrite Nitrogen by FIA			
Total Kjeldahl Nitrogen (as N)	Melbourne	Dec 06, 2013	7 Day
- Method: APHA 4500 TKN			
Heavy Metals (filtered)	Melbourne	Dec 05, 2013	180 Day
- Method: USEPA 6020 Heavy Metals			
Mobil Metals : Metals M15	Melbourne	Dec 05, 2013	28 Day
- Method: USEPA 6010/6020 Heavy Metals & USEPA 7470/71 Mercury			
Alkali Metals	Melbourne	Dec 05, 2013	180 Day
- Method: USEPA 6010 Alkali Metals

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per Kilogram

ug/l: micrograms per litre

ppb: Parts per billion

org/100ml: Organisms per 100 millilitres

MPN/100mL: Most Probable Number of organisms per 100 millilitres

mg/l: milligrams per litre

ppm: Parts per million

%: Percentage

NTU: Units

TERMS

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - ACCEPTANCE CRITERIA

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Organic samples had Teflon liners	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
Q15	The RPD reported passes Eurofins | mgt's Acceptance Criteria as stipulated in SOP 05. Refer to Glossary Page of this report for further details

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Chloride	Melbourne	Mar 17, 2014	28 Day
- Method: MGT 1100A			
Conductivity (at 25°C)	Melbourne	Mar 17, 2014	28 Day
- Method: APHA 2510 Conductivity by Direct Measurement			
pH	Melbourne	Mar 18, 2014	0 Hours
- Method: APHA 4500 pH by Direct Measurement - ** Samples analysed outside holding time. Analysis should be performed in situ. Results for reference only.			
Sulphate (as S)	Melbourne	Mar 17, 2014	28 Day
- Method: In house MGT1110A (SO4 by Discrete Analyser)			
Total Dissolved Solids	Melbourne	Mar 21, 2014	7 Day
- Method: APHA 2540C Total Dissolved Solids			
Total Nitrogen Set (as N)			
Nitrate & Nitrite (as N)	Melbourne	Mar 18, 2014	28 Day
- Method: APHA 4500-NO3/NO2 Nitrate-Nitrite Nitrogen by FIA			
Total Kjeldahl Nitrogen (as N)	Melbourne	Mar 18, 2014	7 Day
- Method: APHA 4500 TKN			
Heavy Metals (filtered)	Melbourne	Mar 17, 2014	180 Day
- Method: USEPA 6020 Heavy Metals			
Mobil Metals : Metals M15	Melbourne	Mar 17, 2014	28 Day
- Method: USEPA 6010/6020 Heavy Metals & USEPA 7470/71 Mercury			
Alkali Metals	Melbourne	Mar 17, 2014	180 Day
- Method: USEPA 6010 Alkali Metals

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per Kilogram

mg/l: milligrams per litre

ug/l: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100ml: Organisms per 100 millilitres

NTU: Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

TERMS

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - ACCEPTANCE CRITERIA

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Chloride	Melbourne	Jun 18, 2014	28 Day
- Method: MGT 1100A			
Conductivity (at 25°C)	Melbourne	Jun 18, 2014	28 Day
- Method: APHA 2510 Conductivity by Direct Measurement			
pH	Melbourne	Jun 18, 2014	0 Hours
- Method: APHA 4500 pH by Direct Measurement - ** Samples analysed outside holding time. Analysis should be performed in situ. Results for reference only.			
Sulphate (as S)	Melbourne	Jun 18, 2014	28 Day
- Method: In house MGT1110A (SO4 by Discrete Analyser)			
Total Dissolved Solids	Melbourne	Jun 18, 2014	7 Day
- Method: APHA 2540C Total Dissolved Solids			
Total Nitrogen Set (as N)			
Nitrate & Nitrite (as N)	Melbourne	Jun 18, 2014	28 Day
- Method: APHA 4500-NO3/NO2 Nitrate-Nitrite Nitrogen by FIA			
Total Kjeldahl Nitrogen (as N)	Melbourne	Jun 18, 2014	7 Day
- Method: APHA 4500 TKN			
Heavy Metals (filtered)	Melbourne	Jun 18, 2014	180 Day
- Method: USEPA 6020 Heavy Metals			
Mobil Metals : Metals M15	Melbourne	Jun 18, 2014	28 Day
- Method: USEPA 6010/6020 Heavy Metals & USEPA 7470/71 Mercury			
Alkali Metals	Melbourne	Jun 18, 2014	180 Day
- Method: USEPA 6010 Alkali Metals

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per Kilogram

ug/l: micrograms per litre

ppb: Parts per billion

org/100ml: Organisms per 100 millilitres

MPN/100mL: Most Probable Number of organisms per 100 millilitres

mg/l: milligrams per litre

ppm: Parts per million

%: Percentage

NTU: Units

TERMS

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - ACCEPTANCE CRITERIA

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code
Method Blank							
Chloride	mg/L	< 1			1	Pass

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	No
Organic samples had Teflon liners	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Chloride	Melbourne	Sep 16, 2014	28 Day
- Method: MGT 1100A			
Conductivity (at 25°C)	Melbourne	Sep 16, 2014	28 Day
- Method: APHA 2510 Conductivity by Direct Measurement			
pH	Melbourne	Sep 16, 2014	0 Hours
- Method: APHA 4500 pH by Direct Measurement - ** Samples analysed outside holding time. Analysis should be performed in situ. Results for reference only.			
Sulphate (as S)	Melbourne	Sep 16, 2014	28 Day
- Method: In house MGT1110A (SO4 by Discrete Analyser)			
Total Dissolved Solids	Melbourne	Sep 19, 2014	7 Day
- Method: APHA 2540C Total Dissolved Solids			
Total Nitrogen Set (as N)			
Nitrate & Nitrite (as N)	Melbourne	Sep 16, 2014	28 Day
- Method: APHA 4500-NO3/NO2 Nitrate-Nitrite Nitrogen by FIA			
Total Kjeldahl Nitrogen (as N)	Melbourne	Sep 16, 2014	7 Day
- Method: APHA 4500 TKN			
Heavy Metals (filtered)	Melbourne	Sep 15, 2014	180 Day
- Method: USEPA 6020 Heavy Metals			
Mobil Metals : Metals M15	Melbourne	Sep 15, 2014	28 Day
- Method: USEPA 6010/6020 Heavy Metals & USEPA 7470/71 Mercury			
Alkali Metals	Melbourne	Sep 15, 2014	180 Day
- Method: USEPA 6010 Alkali Metals

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per Kilogram

ug/l: micrograms per litre

ppb: Parts per billion

org/100ml: Organisms per 100 millilitres

MPN/100mL: Most Probable Number of organisms per 100 millilitres

mg/l: milligrams per litre

ppm: Parts per million

%: Percentage

NTU: Nephelometric Turbidity Units

TERMS

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - ACCEPTANCE CRITERIA

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No
